Collecting dataset: initial ideas

Desired data: photos of people with labeled styles
[formal, punk, vintage, ...]

- No already existing dataset
- Only labeling clothes items

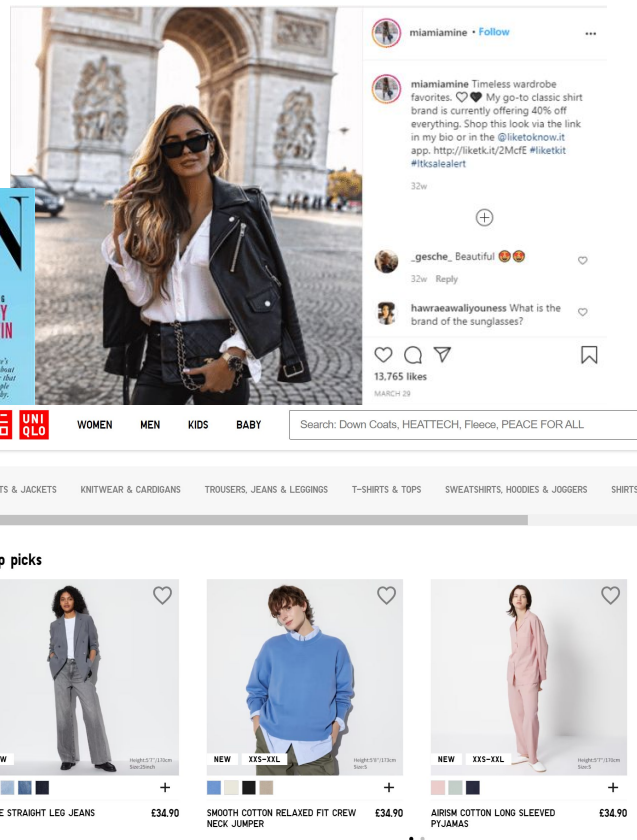

Collecting dataset: initial ideas

Desired data: photos of people with labeled styles
[formal, punk, vintage, ...]

- No already existing dataset
- Only labeling clothes items

Solutions

- Fashion thematic magazines
- Fashion bloggers / influencers
- Online clothing shops

Collecting dataset: initial ideas

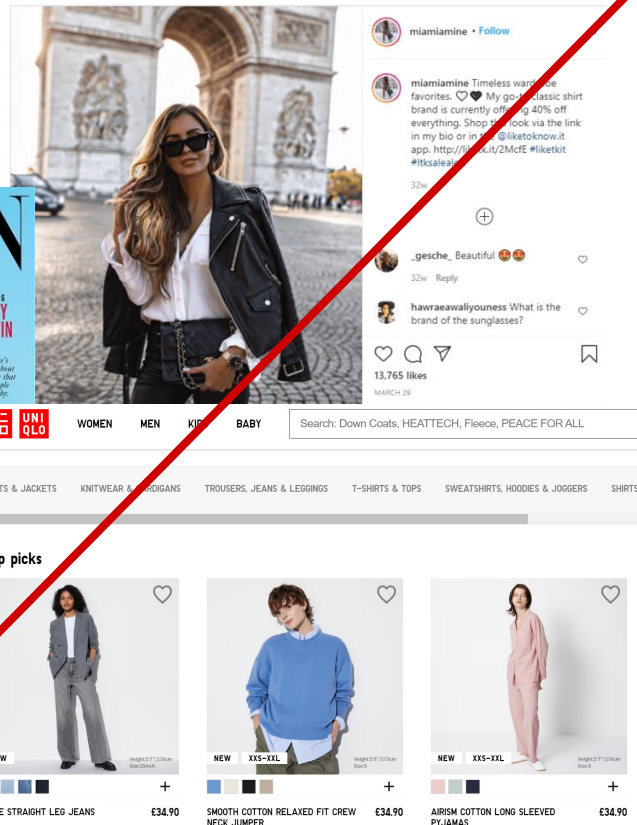

Desired data: photos of people with labeled styles
[formal, punk, vintage, ...]

- No already existing dataset
- Only labeling clothes items

Solutions

- Fashion thematic magazines
- Fashion bloggers / influencers
- Online clothing shops

Common problem: super hard to obtain

Collecting dataset: Pinterest

- Stylish & fashionable by definition
 - Fashion/aesthetic-oriented platform
- Labeled by keywords & tags
- Huge community
 - Relevance
 - Wide choice of images

Collecting dataset: Pinterest

Collecting dataset: scrapping Pinterest

Revolutionary idea: ✨ *Pinterest boards* ✨

- Made by real & various people: less bias, more expertise
- Several 400-600 pins boards = 1 style dataset
 - Pick the best by hand

Download board images

- Official Pinterest API 💰👎 & existing scrappers ☐👎
- Our implementation 💪
 - requests, soap, Selenium vs pagination
 - prompt engineering: keywords, synonyms (glam ↔ runway), specifics (fall + vintage)

Collecting dataset: img_fashion_styles

- Size: 22.806 images
- Men/women ~ 50/50

Collecting dataset: img_fashion_styles

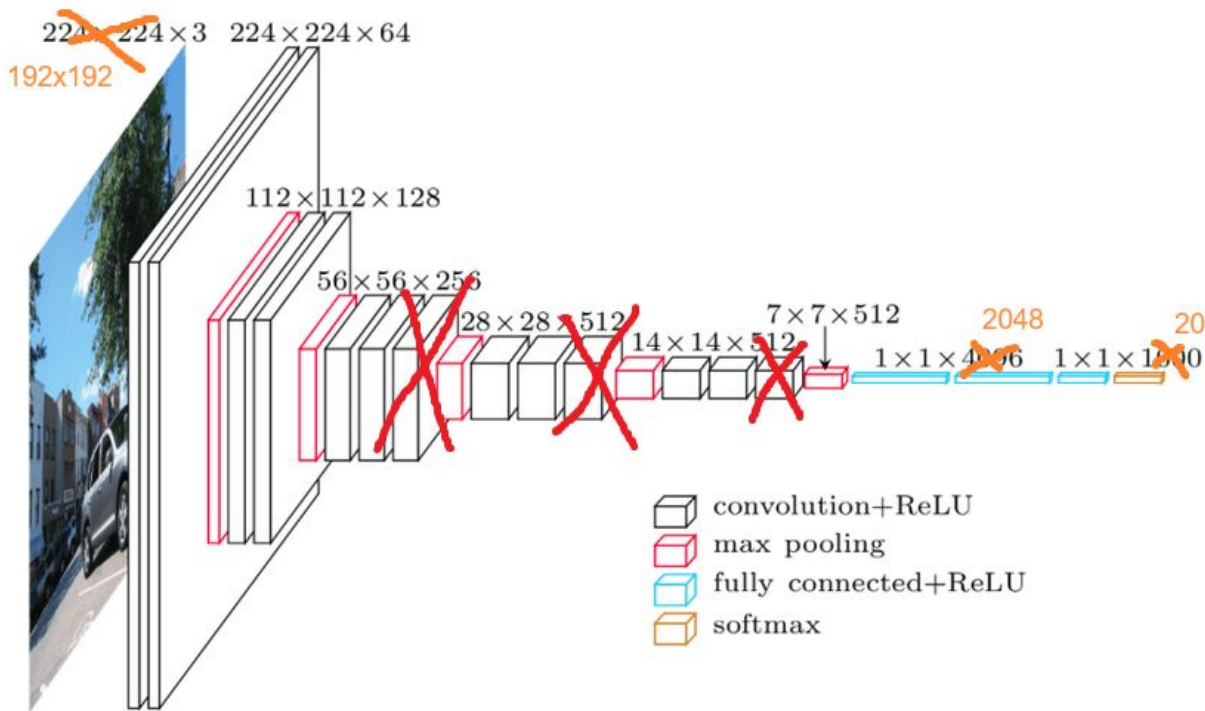

Training the model

- Hardest part for us
- Start with small sample projects
 - MNIST, CelebA
- Then use something well-known & simple :D

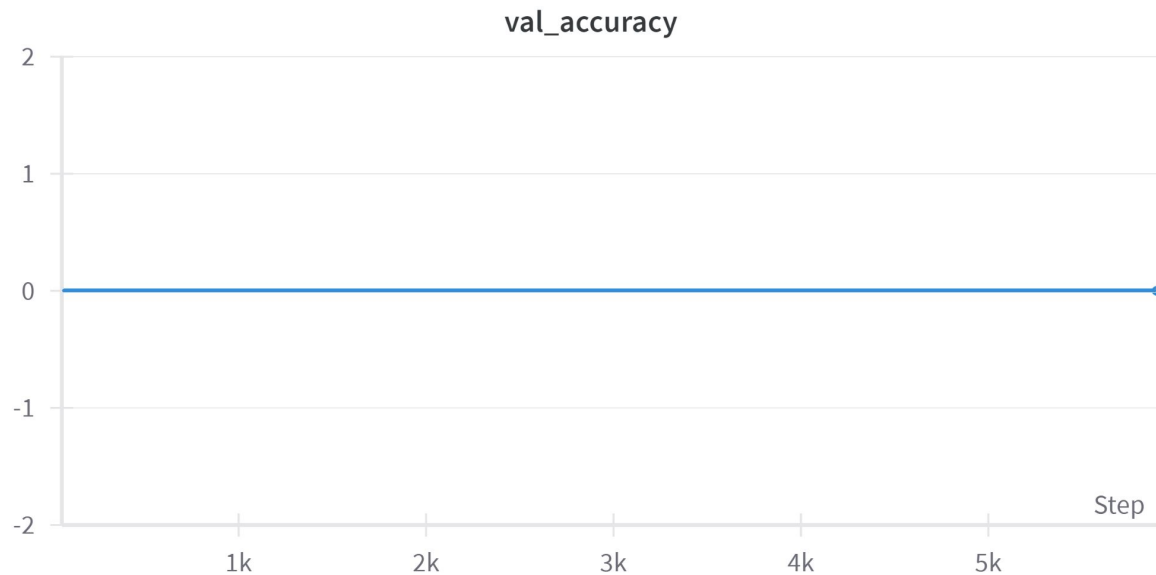

Training the model: architecture

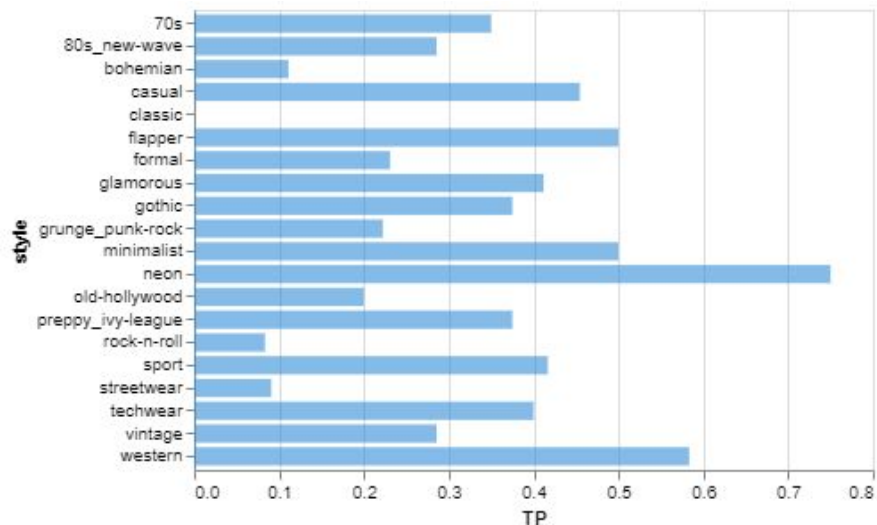

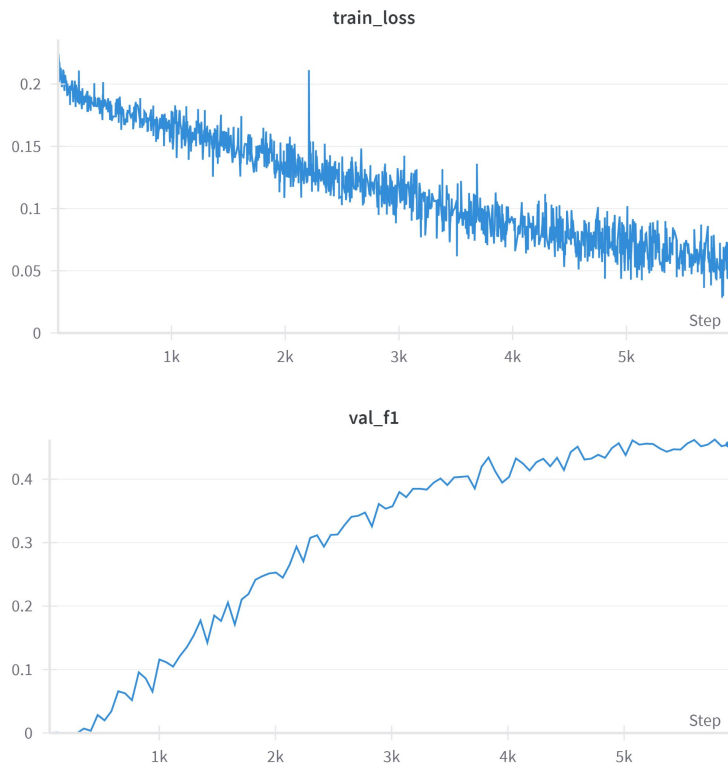

- VGG-based
- Multilabel?
 - Or multiclass?
 - Let's try both...

Training the model: results?

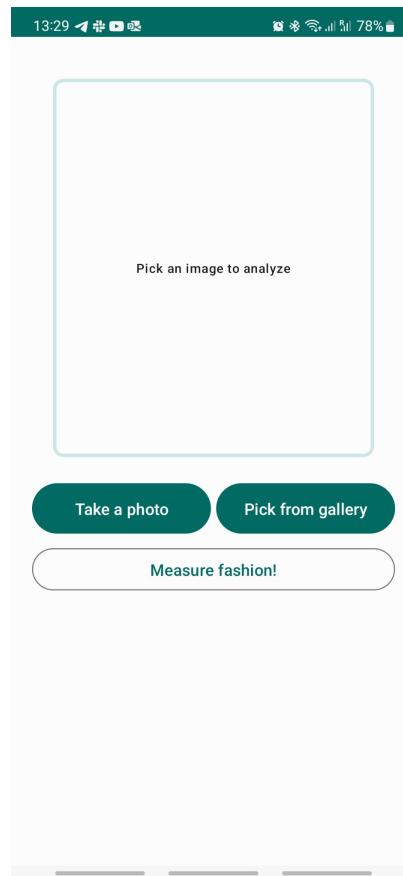

Training the model: results

- Test F1 = 0.42
- Accuracy is broken :)
- TN is 0.99 for all classes (duh)

Making the app

- Telegram bot: ew
- Android app: ✨
 - ✨ ✨ ✨ ✨ ✨
 - Already know a bit

Deploying the model

- Server: FastAPI ⚡
- Deploying: Docker 📦
- Hosting: Azure 🐙

The screenshot displays the Microsoft Azure portal interface for a Container App named 'fashionpulse'. The left sidebar shows the navigation menu with options like Overview, Activity log, Access control (IAM), Tags, Diagnose and solve problems, Application, Revisions, Containers, Scale and replicas, Settings, Authentication, Secrets, Ingress, Continuous deployment, Custom domains, Dapr, Identity, and Service Connector (preview). The main content area shows the 'Essentials' section with the following details:

- Resource group: FSDI
- Location: Germany West Central
- Subscription: Azure for Students
- Subscription ID: 4ce94de9-b505-4855-bcd9-e122759ef091
- Tags: Add tags
- Application Uri: <https://fashionpulse-icyglacier-6191089c-germanywestcentral.azurecontainerapps.io/>
- Container Apps Environment: [managedEnvironment-FSDI-8bf0](#)
- Environment type: Workload profiles
- Log Analytics: [workspacefda885](#)

Below the Essentials section, there are tabs for Revisions with Issues, Properties, Monitoring, and Get started. The 'Properties' tab is active, showing the following details:

- Container App: Provisioning Status: Succeeded, Revision Mode: Single, Latest Revision Name: fashionpulse--fashionpulse-rev1, Workload profile: Consumption (Change)
- Networking: Ingress: Enabled, Outbound Ip Addresses: 20.113.47.91, 20.113.46.72, 20.113.4...

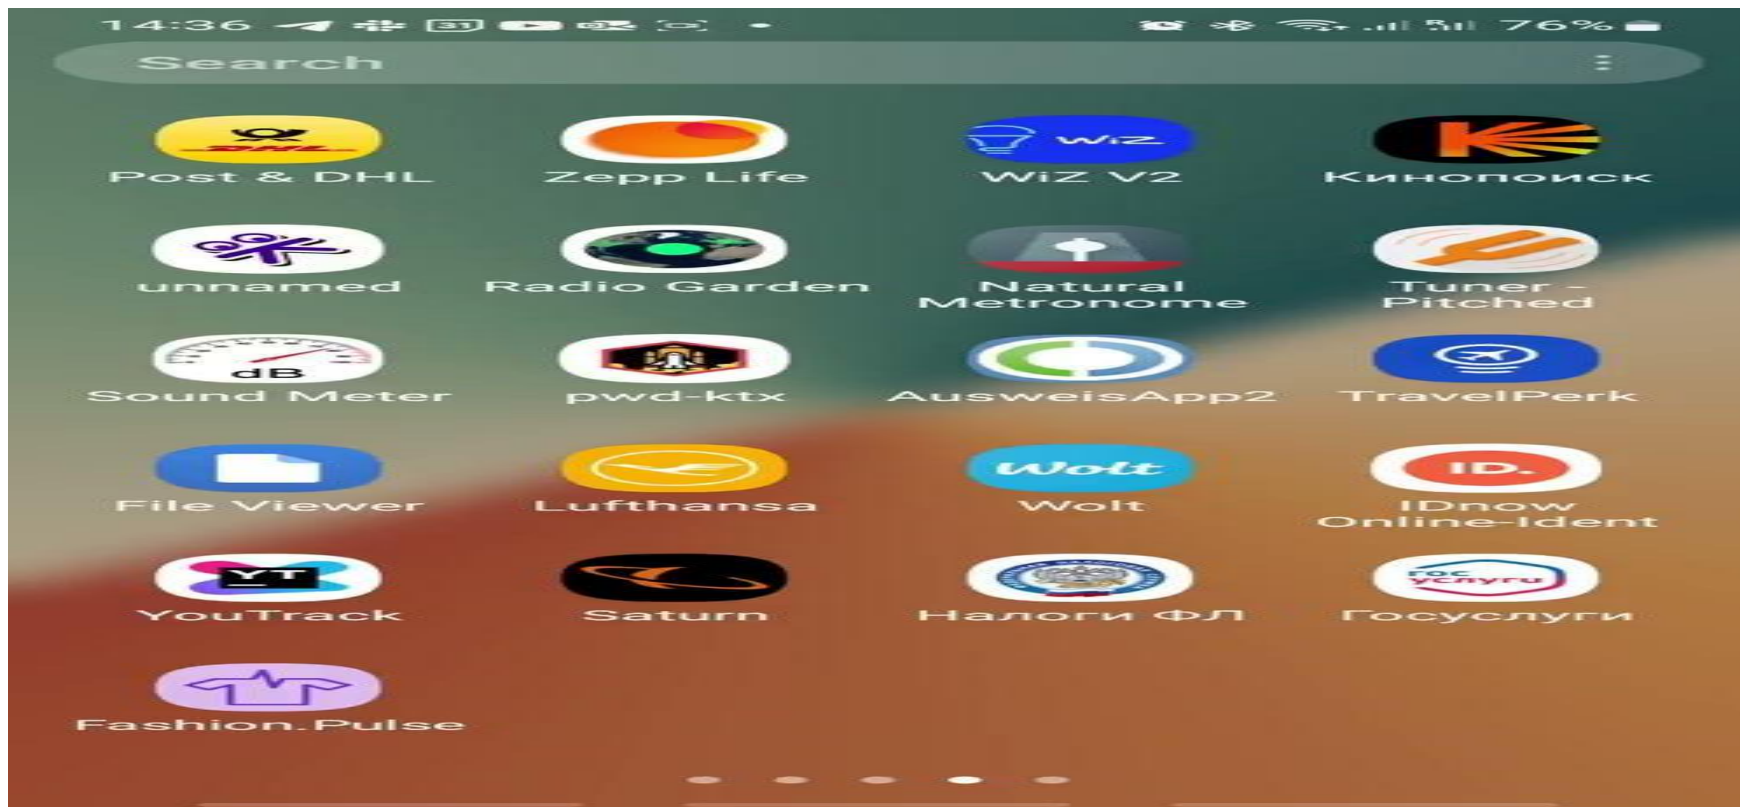

Summary: key problems

- Incomplete docs  (outdated guide, errors)
-  Python 
- Manually collecting Pinterest boards 
- Deploying for the first time
